Market Research

Mental health is increasingly receiving attention

Pressure from studies, work, and life is driving an increased need for mental health care, especially among young people.

- 40% of Gen Z frequently feel stressed or anxious.
- Only about 50% rate their mental health as good or very good.

(Source: Deloitte Gen Z & Millennial Survey 2024)

1

1/5 teenagers

experience mental health issues, but only 8.4% have access to support services

(Source: UNICEF)

2

61,7% of students

show signs of stress, with 25.1% at severe or very severe levels.

(Source: Đại học Ngoại ngữ, Đại học Quốc gia Hà Nội)

User Research

Users Problems

Stress

Pressure from studies, work, deadlines, and life.

Life Balance

Difficulty balancing work and personal life.

Low Self-Confidence

Comparing oneself to others on social media.

Anxiety

Overthinking, insomnia, and worrying about the future.

Emotional Control

Easily angered, overthinking, mood swings.

Loneliness

Feeling isolated or lacking someone to talk to.

Burnout

Loss of motivation and decreased performance.

Habit Building

Difficulty maintaining healthy habits and routines.

(Nguồn: UNICEF)

User Research

Problems Solving

How users handle their moods

Group 01

SELF-SOLVE

Listen to music / Watch movies / Play games / etc.

Group 02

TALK TO FRIENDS

Confide directly with friends, lovers, or relatives.

Group 03

FIND CONTENTS ON INTERNET

Watch and read a lot of information on the Internet to find ways to handle personal emotions at each moment.

Group 04

USE MENTAL HEALTH APPS

Use Self-care/Mental Health Apps like Headspace, Calm, Wysa, Daylio.

User Research

Pain Points

01

DO NOT REALIZE THE PROBLEM EARLY ENOUGH

Suffer from heavy burnout, prolonged insomnia, and severe stress.

04

UNPERSONALIZED CONTENT

Users of Mental Health apps often only receive general, non-specific solutions.

03

CANNOT MAINTAIN HABITS

Can or know how to practice good habits for themselves but cannot sustain them.

02

LACK OF PEOPLE TO SHARE WITH

Do not want or hesitate to share with relatives but do not dare to see an expert immediately.

User Research

User Need

WANT TO BE LISTENED TO

Want to share, receive feedback, and empathy.

UNDERSTAND THEMSELVES

Want to know why they are often stressed, overthinking, or what makes them exhausted.

IMMEDIATE RELIEF

Calm down when anxious, reduce stress quickly, and sleep easier.

LONG-TERM IMPROVEMENT

Form positive habits.

Competitor Analysis

Daylio

Moodfit

Calm

Wysa

Headspace

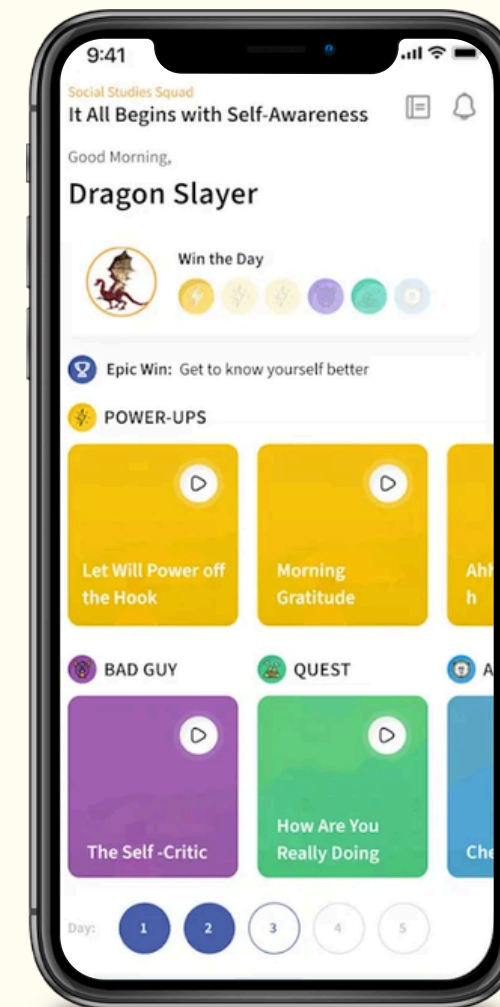

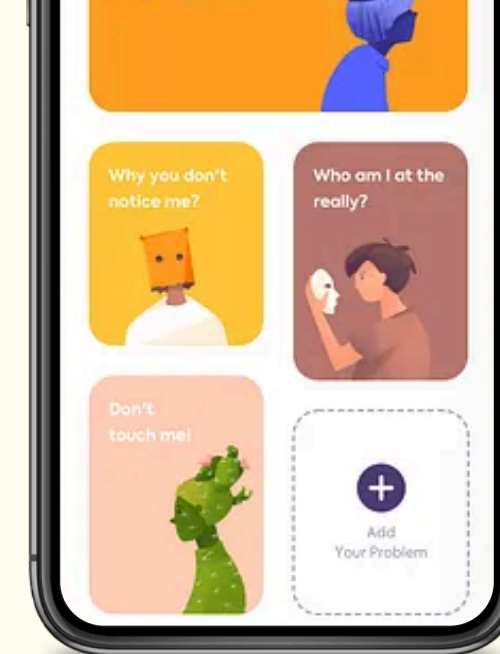

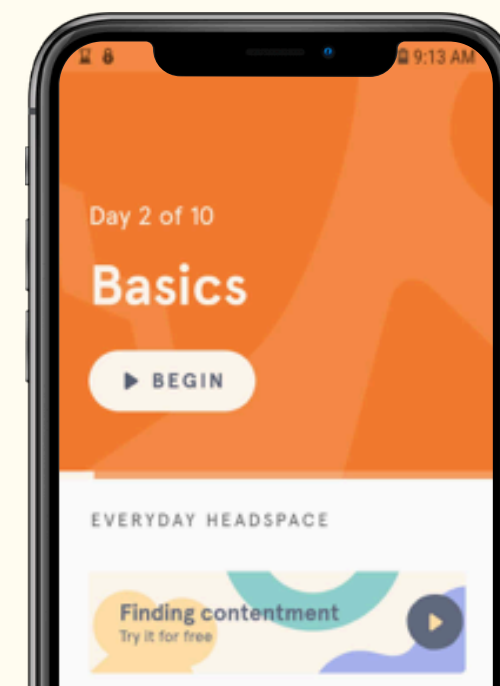

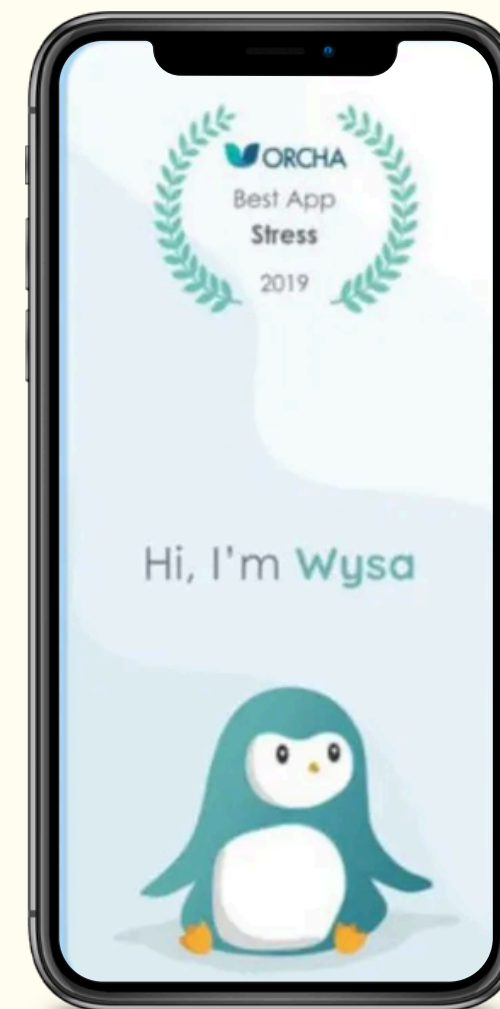

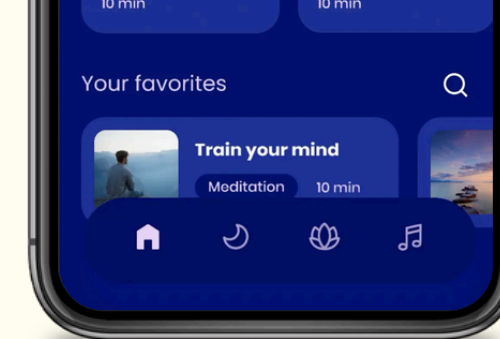

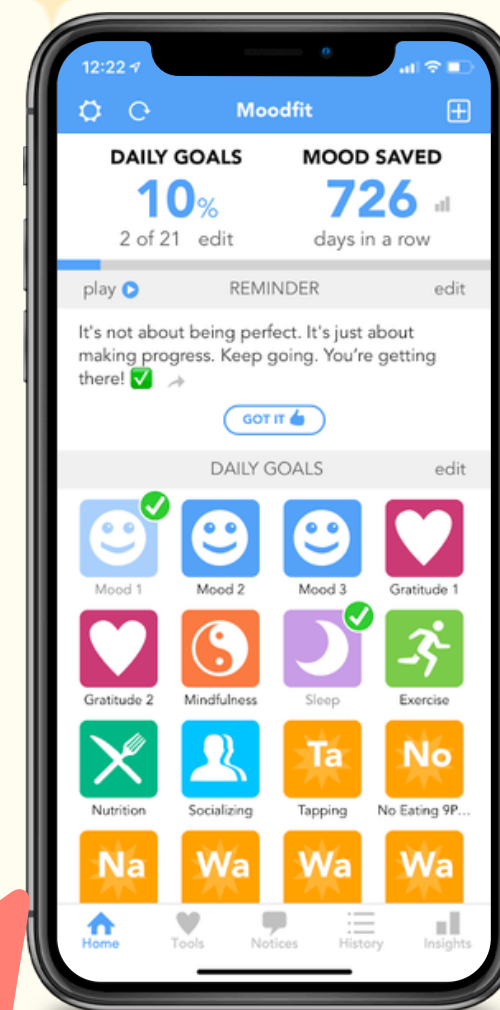

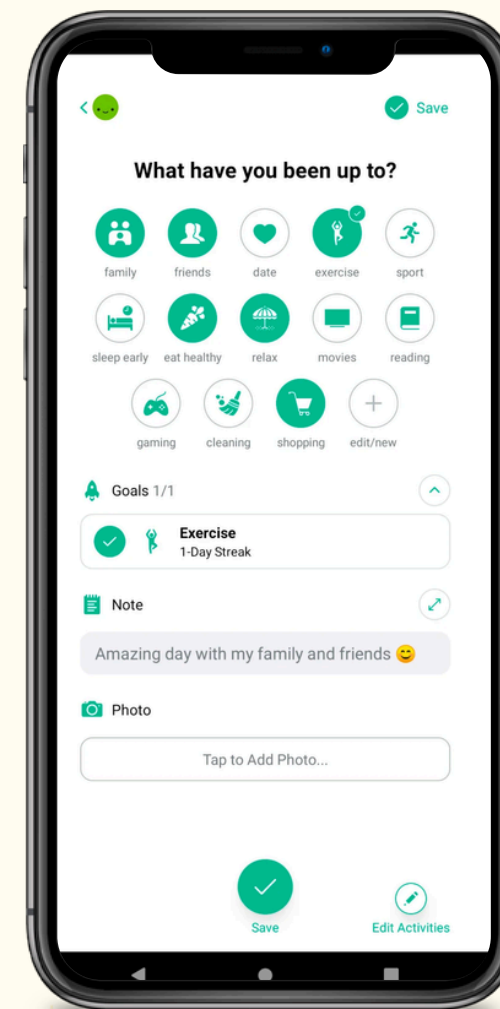

Happify

SuperBetter

Woebot

Competitor Analysis

Daylio	Moodfit	Wysa / Woebot	Calm / Headspace	Happify / SuperBetter
Strengths • Visual emotion icons • High customization • Data visualization • Beautiful, eye-catching UI	Strengths • Tracks multiple variables • Integrates CBT tools • Understands the causes of emotions	Strengths • 24/7 live chat • Connects to therapists • CBT/DBT exercises • Micro lessons	Strengths • High-quality content • Strong brand, beautiful UI • Broad use-case coverage	Strengths • Gamification – fun, easy to start • Scientific transparency • Community & Ally feature
Weaknesses • Does not explain causes • Early paywall • No AI analysis	Weaknesses • Complex UI, “dashboard” feel • Lacks personalized AI • No voice (feature)	Weaknesses • Old AI, no memory • Little true personalization • Scripted feel	Weaknesses • No mood tracking / root cause (analysis) • Passive – user listens rather than reflects • Little personalization	Weaknesses • No mood tracking / insight • Long onboarding, easy to drop off • Not suitable for people who do not like games

Competitor Analysis

	Daily mood tracking	Emotion root cause analysis	Truly personalized AI	Insights over time (pattern)	Lifestyle data integration	Chat / interactive conversation	Challenges	Easy onboarding UX, low friction	Sufficient free version	Suitable for the Vietnamese context
Daylio/Moodfit	✓	✗	✗	!	✗	✗	!	✓	✗	✗
Wysa/Woebot	!	!	✗	✗	✓	✓	✗	!	!	✗
Calm/Headspace	!	✗	✗	✗	✗	✗	✗	✓	✗	✗
MindDoc	✗	!	✗	!	✗	✗	✗	!	!	✗
Happify/SuperBetter	✗	✗	✗	✗	✗	✗	✓	✗	!	✗

User Research

Market Gap

No app explains why users feel the way they do; they only record surface-level moods.

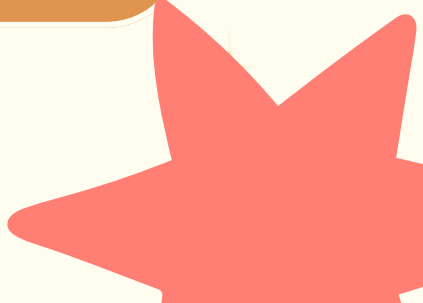

Truly personalized AI is almost nonexistent; all apps provide the same exercises and content.

No app integrates and analyzes the correlation between sleep, mood, habits, and life events.

There is a gap between “self-care” and “seeing an expert” with no deep enough intermediate bridge.

Mood tracking and root cause analysis have not been integrated into the same product.

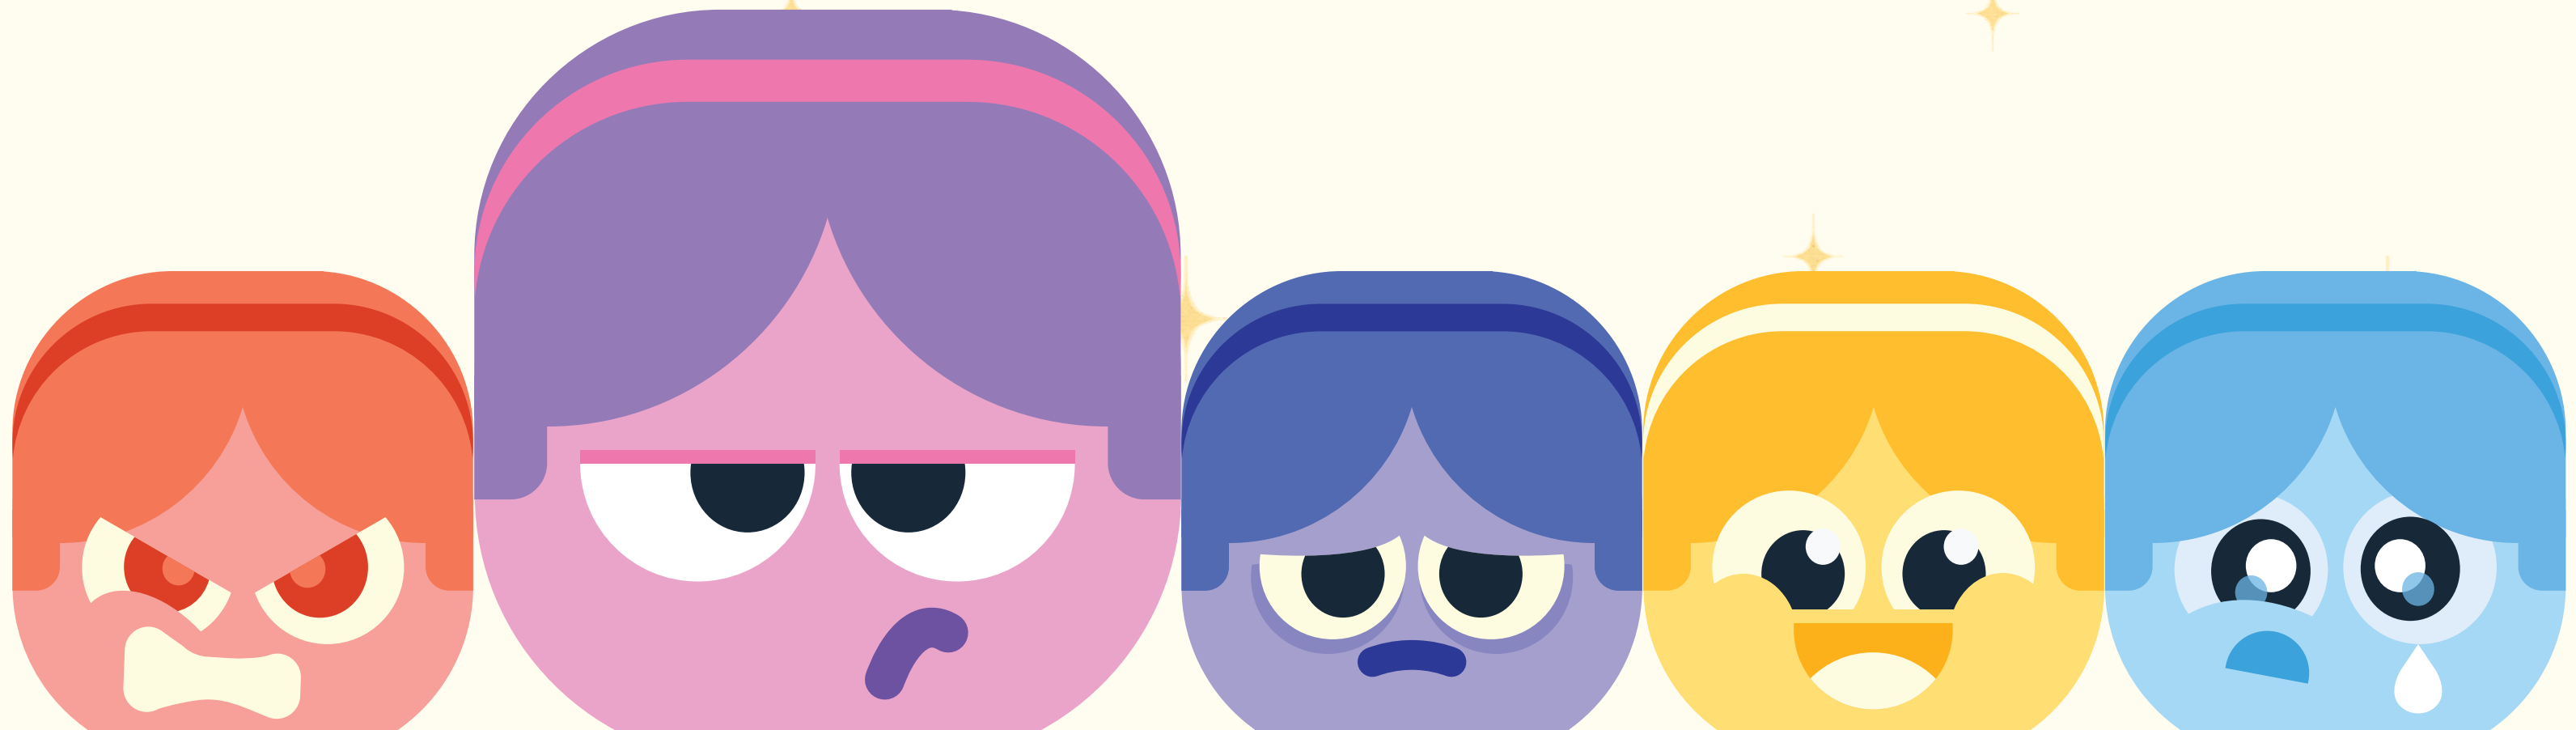

Mental health apps are not strongly developed in the Vietnam market due to language, cultural, and contextual barriers.

Number of participants: **9**

In-person and Online interviews

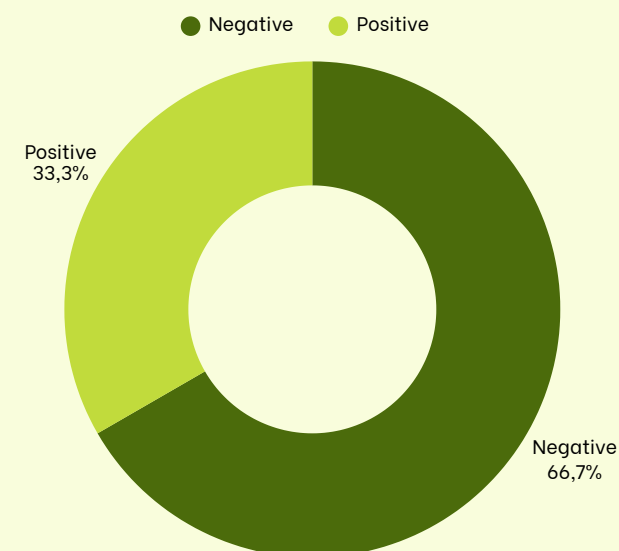

Interview plan: **18** questions,
average 15 minutes/person

Survey Result

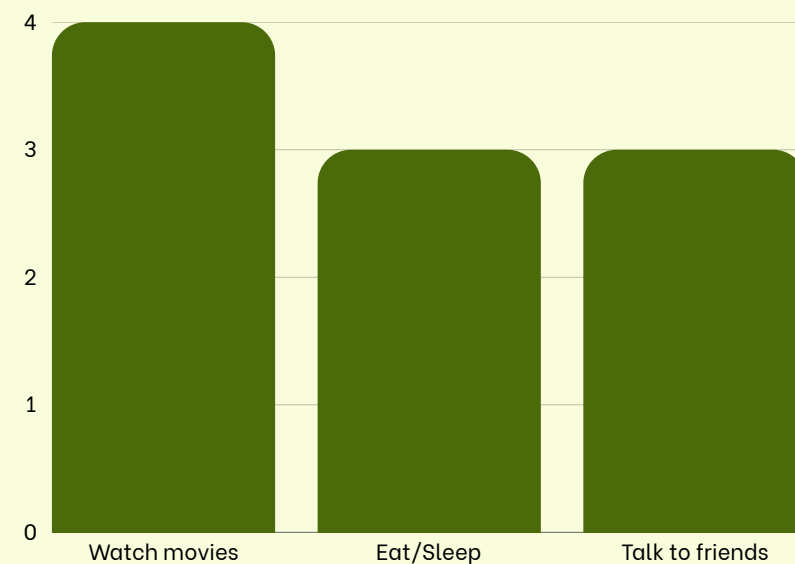

The survey results outline a concerning reality: Users are being overwhelmed by negative emotions, but only know how to rely on passive relief habits.

However, the majority admit that these coping methods are completely ineffective, leaving them stuck in a stress loop.

Emotions frequently appearing
in the last 2 weeks

Current relief habits

The effectiveness of
current relief habits

Survey Insight

User Need

Theoretical awareness and execution ability

Users know very well what they need to do, but psychological barriers leave them “paralyzed” from taking action. Directive advice is almost useless and only adds pressure on them to fail.

The need to dig deep into root causes

They reject temporary “painkillers.” What they need is cognitive enlightenment: Why do they react that way? Where is the root of the problem? The solution must dissect the psychological mechanisms rather than just treating surface symptoms.

Advice is only for confirmation

When seeking advice, deep inside they often already have a hidden/implicit decision. They do not need a novel direction, but rather alignment to confirm that their thoughts are reasonable, from which they gain the courage to take action themselves.

Emphasizing the process of self-awareness

With high psychological defenses, they easily reject dogmatic advice. The ideal solution must not “preach” or “teach,” but rather provide perspectives and act as a mirror for them to observe, diagnose, and realize their own problems.

Survey Insight

User Need

“Users do not lack advice, they lack a reliable space to connect emotions and understand themselves.”

User Persona

STUDENT WANTING TO UNDERSTAND HERSELF

NGUYỄN MINH NGHI

- Age: 21
- Occupation: Student
- Marital status: Single (Unmarried)
- Address: Ho Chi Minh City

General Introduction

Minh Nghi is an elite student with many good academic achievements and is always conscious of self-improvement from within. She always wants to understand herself deeper but doesn't know where to start.

Personality

- Ambitious, striving in studies and career.
- Hard to accept external counseling/advice.

Devices and Usage Behavior

- Phone (70%) and Laptop (30%).
- Surfing TikTok 2-3 hours/day, studying, and watching movies (Netflix, TikTok, ...).
- Prioritizes using entertainment apps.

Goals

- Wants to track personal health.
- Find the root causes leading to those emotions.
- Improve mental health, physical health.
- Find many solutions to help relieve stress.

Problems Currently Faced

- Cannot name her own emotions, frequently feels empty and aimless without knowing the reason why.
- Always encounters stress leading to negative actions.
- Always puts pressure on expectations of herself.

Priority for Information Channels

- Internet (Searching for the causes of problems).
- Facebook/Threads - (Reading articles on how to handle psychological problems).
- Mental health support apps - (Supporting to find temporary solutions).
- TikTok/Netflix (Entertainment).

Favorite Apps

“Always wanting to understand myself deeper in order to improve both mental and physical health, but I don't know what to do.”

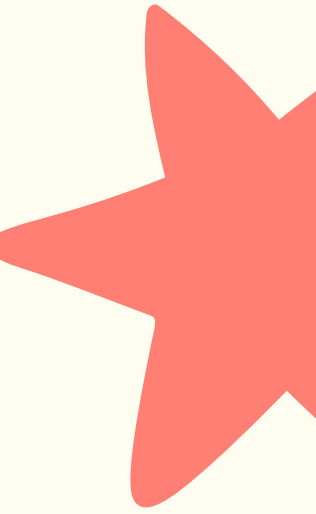

03

Orientation and Proposed Solutions

- Empathy Map
- User Journey Map
- How Might We
- Solutions

Empathy Map

SAYS

- “My mood recently is always unstable without knowing why“
- “Entertainment only has a temporary effect and the stress will return right after“

THINKS

- “How can I know the cause that makes my mood become unstable?“
- “How can I escape from those negative thoughts?“

DOES

- Search online to identify the problem I am facing
- Use Apps to support mental health
- Surf social media for entertainment

FEELS

- Only creates a feeling of excitement at that moment, does not completely resolve the issue
- Feels the need for a method with a gentle, non-“dogmatic“ approach and complete effectiveness

User Journey Map

Scenario: User checks in daily emotions

Actions	Receive notification	Open app, record emotion	Receive feedback	View suggested activities	Review history	Forget the app
Tasks	• User receives a notification reminding them to record their daily emotion.	• Open app. • Select an icon matching that day's emotion. • Add notes.	• Receive feedback, view the app's suggestions.	• Click to view activities/exercises. • Select and perform those activities/exercises.	• Open the history section to view the dashboard tracking their emotions.	• User forgets to open the app for 3 - 5 days.
Feelings	 Slightly annoyed	 Normal, familiar	 Disappointed because the feedback is not as expected	 Mood is slightly better	 Normal, familiar	 Disappointed, guilty
Pain Points	• Notification easily makes users ignore it. • Too easy to delete or ignore the notification. • If sent too much and frequently, it can cause annoyance.	• Cannot select multiple emotions at once. • No voice input. • User might not know their exact emotion at that moment, leading to wrong input. • Only a few fixed icons/labels.	• Feedback/encouragement is general, mechanical, doesn't feel like a real friend. • Conversation content is interrupted due to old memory/AI.	• Exercises are still general, not specific to a problem. • Users often have to scroll themselves to choose an exercise. • Lack of detailed information/results for that exercise in a visual way. • Only gives instructions but no tracking of the user's progress and results.	• Usually a raw chart, without any conclusions/explanations provided.	• Feeling of having to start over from the beginning. • Interrupted data makes the provided results inaccurate. • No activities good enough to retain users, losing motivation to maintain.
Opportunities	• Learn user habits to recognize the time users want to receive notifications. • Make receiving notifications more stimulating and attractive.	• Support voice input. • Can select multiple emotions. • Consult emotions for users based on the information they provide. • Have memory from previous times to ask personalized questions.	• Have better memory to build seamless conversations, creating a feeling that the user is cared for. • Provide more personalized results and feedback.	• Suggest activities right after the user checks in their emotion. • Suggest activities based on the specific root cause identified. • Display information and instructions of the exercise using images and videos. • Track the user's execution.	• Dashboard accompanied by more detailed statistics. • Draw conclusions based on the chart. • Combine with previous inputs and exercises to provide more detailed information about the user.	• Do not focus on keeping streaks, but focus on checking in with users about the missed days after they return.

User Journey Map

Scenario: User wants to find out the reason why

Actions	Want to understand emotions	Describe emotions & symptoms	Receive results	View suggested actions
Tasks	• Feel stressed, sad but don't know why. • Open app to find out	• Answer questions (multiple-choice format) about emotions, physical state, and recent situations.	• App analyzes based on previous answers and provides results. • User views the analysis results.	• App suggests next steps: exercises, habit changes, or seeking an expert. • If signs requiring professional help are detected, the app suggests connecting with an expert.
Feelings	 Vague, confused	 Vague, confused	 Surprised	 Anxious
Pain Points		• Questions follow a general form, not personalized. • Cannot write/speak about emotions in text format.	• Results are only based on user's answers and lack other factors (sleep, activities...). • User's answers might be somewhat one-sided. • If insights are too general or wrong, users might lose trust. • Ends after providing results, cannot dig deeper. • Language is mechanical, not yet friendly.	• Exercises are still general, not linking actions to the specific root cause found. • Users often have to scroll to choose exercises themselves. • Lack of detailed information/results for that exercise in a visual way. • Only provides instructions but no tracking of the user's progress and results. • No clear handling method when the problem exceeds the app's self-care capabilities.
Opportunities		• Input in written form rather than just multiple choice. • Questions are generated based on user input data, avoiding general questions. • Questions are presented more like a conversation rather than a rigid questionnaire. • If the problem feels serious, can seek advice from an expert.	• Combine data from other sources (sleep, schedule...) to provide evidence-based hypotheses for root causes. • Present insights as hypotheses, not absolute affirmations; users confirm or request edits. • After providing results, allow further conversation to understand the root cause deeper. • Design friendly language suitable for Vietnamese people.	• Each suggested action clearly explains why it fits the newly found root cause. • Track the user's execution of exercises. • Have a hotline for cases where seeing an expert is recommended.

How Might We

1

How might we turn the journey of self-discovery into a gentler and more healing experience?

2

How might we help users realize the behaviors/habits that they should improve?

Solutions

How might we turn the journey of self-discovery into a gentler and more healing experience?

1

The app provides cute emotion emojis for users to choose as their mood for that day instead of immediately writing about their feelings.

2

The Daily Challenge feature offers fun, short challenges for users to complete based on user preferences.

3

In the Journal feature, the app provides 2 modes: Self-talk and Chat (with AI) for users to choose according to their habits and personal needs.

Solutions

How might we help users realize the behaviors/habits that they should improve?

1

The View Statistics function in Mood Tracking allows users to review their personal mood data and sleep indicators (in case the user is connected to a sleep tracking device).

2

During Chatting/Journaling, users can track their own emotions, health, etc., thereby making appropriate adjustments to improve their mood, lifestyle habits, etc.
